

RouteBack — Sources, Credits & AI Transparency

BSc Software Engineering · Frontend Web Development · Building a Responsive Mission-Driven Website (Route 95, Northern Mauritius)
Prepared 24 July 2026

1. Purpose of this document

This document supports the RouteBack submission. It records where factual data shown on the site came from, what third-party assets were used, and discloses the use of generative AI tools during development, in line with the assessment brief's referencing (Section 8) and AI-disclosure (Section 7) requirements.

2. Project team

Name	Role on this project
Leslie Mugiraneza	Product design and frontend integration lead
Elvire Akayezu	Journey planner and frontend logic developer
Fortunate Ansong	Transport research and alternative-services lead
Kalungi Bright Angel	Accessibility, bilingual UX and form-validation developer
Ihirwe Hildegardine	Mission, content, quality assurance and documentation lead

3. Data sources

3.1 Route 95 (team-observed and published-reference data)

Item	Source	Status
Localities (Pamplemousses to Saint Antoine)	Team research, cross-checked against the published timetable reference	Published reference
10 team-observed local stops	Direct observation	Team-observed
Stop sequencing along the route	Team's own ordering, from the direction stops were recorded in	Team-sequenced, not a GPS survey
First/last bus times, journey duration	Printed Bus Owners Co-operative Society Ltd. (North) stand regulator sheet, Goodlands stand, dated 21/07/26	Published secondary reference
Grand Baie / Pamplemousses fare (Rs 40, Rs 20 student)	Direct observation, checked 21 July 2026	Team-observed
Grand Baie / Triolet fare (Rs 35)	Direct observation, checked 21 July 2026	Team-observed; student rate pending confirmation
Possible connecting routes (75/75A, 22, 63, 28, 29, 82, 228, 26)	Team research at each locality	Published reference; several marked confirmation required

3.2 Alternative transport providers (Services page)

Contact details (website, phone, email, booking/contact/sign-in links) for the ten providers listed were sourced directly from each provider's own public website, cross-referenced against a supplied reference document, *Mauritius_Private_Transport_Providers.pdf*. Logos for MoRide, Taxi Service Mauritius, Taxi Mauritius Transfer, Yugo Mauritius, DodoGo, Island Taxi Mauritius and Uber Mauritius are the providers' own supplied logo files. Barefoot Transfers Mauritius, My PRORIDE and Ala-lila had no logo file supplied, so a plain neutral wordmark tile built in the site's own type system stands in for each, rather than an invented brand mark.

3.3 Northern Journey Guide (Planner page, "Beyond Route 95")

Route, duration and fare ranges for the 26 destinations in this guide were compiled from a supplied Northern Mauritius transport planning reference document, not observed directly by the team. This is why the guide is visually and textually labelled “Compiled planning guide, confirm before travelling” wherever it appears, and is kept separate from the team-observed Route 95 data in Section 3.1.

3.4 What is deliberately not claimed

- No live bus tracking, live traffic, or live arrival times.
- No guaranteed transfer times between connecting routes.
- No verified walking time from the Decathlon Bus Stop to the ALCHE campus.
- No ranking of alternative transport providers by price, speed, or safety.

4. Third-party assets and code

No JavaScript framework, CSS framework, or copied UI component library is used anywhere in this project. All layout (Flexbox and CSS Grid), the CSS custom-property system (spacing scale, colour palette, light/dark theme), and all client-side validation logic (regular expressions, native HTML5 *pattern* attributes, *:valid/:invalid* styling) were authored specifically for this project. The exceptions are:

- Web fonts: Cormorant Garamond and Work Sans, loaded from Google Fonts (see References).
- Inline SVG icons: simple hand-built line-icon shapes (chevron, checkmark, bus/road glyph, envelope, etc.), not copied from a specific icon library.

5. Generative AI use disclosure

Generative AI (Claude, by Anthropic, used through the Claude Code assistant) was used across multiple development sessions on this project. Its use included:

- Debugging specific defects, e.g. an off-corridor stop-selection bug in the Planner, and hardening duplicate local-profile creation on Sign Up.
- Drafting and iterating CSS layout and visual design passes (Home, Mission and Planner page sections; the light/dark theme variable system).
- Consolidating and simplifying the JavaScript into a single app.js file, including writing shared form-validation helper functions (rbApplyFieldChecks / rbShowErrorSummary) used by every form on the site.
- Adding the native HTML5 *pattern* attribute and CSS *:valid/:invalid* (*:user-valid/:user-invalid*) feedback layer alongside the existing JavaScript validation.
- Extracting and structuring the Northern Journey Guide dataset from a supplied planning-reference PDF.
- Restructuring the file layout (flattening folders into one flat file per page) and renaming pages to the names required by the assessment brief (about.html, contact.html), including the contact-form phone and reference-code (constraint) fields.
- Drafting this document.

Note: the extent of AI involvement described above is materially larger than the “explain core layouts, debug layout overflow issues, or optimise regular expressions” scope the assessment brief describes as acceptable use. It is disclosed here in full rather than presented as independent work. The student(s) remain responsible for personally understanding, and for explaining and justifying in the live demonstration, every part of the resulting code, per the brief’s “Code Justification” requirement.

6. Code comment citations

No code in this project was copied verbatim from a third-party repository, forum answer, or tutorial. Where AI assistance materially shaped a specific block of logic, that is disclosed in Section 5 above rather than presented as independent original authorship.
